

A. One channel, $j = 1, \dots, 6$: isolated input and two persistent branches

Repeated A_j, B_j labels denote the same channel conductors. Returns with different names are unconnected. Finite selectors are shown as resistive paths.

B. Twelve separate branch windings, one shared output core, one receiver

Panel B repeats the branch windings of panel A; it adds no conductors between channels. Dashed links show magnetic coupling. The tables give copper, gates, parasitics, clamps and all seven probes.
